                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence of the peptide shown in AAR72739 corresponds to the C-terminal sequence of both the mouse and the human ribonucleotide reductase (RR) R2 subunit. The acylated form of the peptide is an inhibitor of mammalian RR activity (IC50 = 10-20 microM on mouse R2). Various peptides (including the present peptide, AAR72768) were prepared in acylated and non-acylated form and assayed for inhibitory effects on mammalian RR, compared to AAR72739. It was found that the acylated form of the peptide given in AAR72740 was 8-16 times less potent an inhibitor and was also found to specifically inhibit RR activity of Plasmodium falciparum. It is thus a preferred peptide of the invention, having antimalarial activity with little inhibitory effect on mammalian (including human) ribonucleotide reductases. The acylated form of the present peptide had an IC50 value of 40-42 microM against mouse recombinant RR R2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

Sequences AAW70114, AAW70142-W70154 are N-terminal amino acid sequences of peptides generated by chymotrypsin/trypsin digestion of the 45 kDa Mp7 32 91ycoprotein. These sequences were obtained by purifying the 45 kDa protein, digesting it with chymotrypsin/trypsin, and then separating the products by reversed-phase HPLC on a column. All of the peptides were
                                                                                                                  Early detection of mycobacterial infection - fluid sample from a subject for the presence with Mycobacterium tuberculosis antigens
                                                                                              Example

                                                                                  Peptides AAW45983-W456025 are based on portions of somatostatin, somatostatin receptors (SSTR) and insulin-like growth factor binding proteins (IGFBP). They are capable of increasing weight gain, birth weight, growth rates, milk production, levels of circulating insulin, IGF-I and IGF-III, fibre production and muscle weight. They may be used to modulate carbohydrate metabolism and in treatment of diabetes. The oil carrier may be used for delivery of the peptides.

                                                                                                                                                                                                                                                                                                                                                                                  Arabidopsis acetohydroxy-acid synthase (AHAS) small subunit is needed CC for branched-chain amino acid synthesis and so is essential for life. CC AHAS is also known as acetolactate synthase. Inhibition of this enzyme CC in plants would lead to plant death and therefore inhibitors would be potential herbicides. Certain herbicides are known to inhibit AHASs: CC imidazolinones, sulfonylureas, triazolpyrimidine sulfonamides. CC pyrimidyl-cvy-benzoic acids, sulfamoylureas and sulfonylaraboxamides. CC Mutant AHAS may be resistant to these herbicides and may be used to CC create herbicide resistant transgenic plants e.g. dicot and monocot crop plants. A thrombin cleavage site was incorporated into an AHAS small companies. A thrombin cleavage site was incorporated into an AHAS small subunit gene fragments were cloned into CC plasmid expression vectors, and were expressed as glutathione CC transferase was then cleaved via the thrombin cleavage site. Cleavage transferase was then cleaved via the thrombin cleavage site. Cleavage core details the CC are maintained on the AHAS protein. The present sequence details the CC are maintained on the AHAS protein. The present sequence details the CC are maintained on the AHAS protein and serine residues of the cleavage site CC are maintained on the AHAS protein. The present sequence details the CC and filarion due to cleavage site and serine residues of the cleavage site CC are maintained on the AHAS protein. The present sequence details the CC and filarion due to cleavage site site and serine residues of the cleavage site composition of the cleavage site composition of the coleavage site coleavag

                                                                                                                                                                                                                                                       The invention relates to a composition comprising a peptide inhibitor of ribonucleotide reductase. Peptides AN/83839-Y83864 represent examples of the inhibitor peptides used in the composition. The peptides are synthesised based on the sequences of known mammalian, bacterial and viral ribonucleotide reductases. The compositions are used in the treatment of disorders associated with DNA replication, such as tumour growth and metastasis and infectious disease, such as those caused by viruses, bacteria, fungi and parasites.
                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; antibacterial; virucide; antifungal; parasiticide; virus; antimetastatic; ribonucleotide reductase; peptide inhibitor; bacteriu DNA replication; tumour growth; metastasis; fungus; parasite.

                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC mycobacterial disease or infection comprises assaying a biological fluid CC sample for the presence of early antibodies pecific for an 88 kDa CC Mycobacterium tuberculosis (Mt) protein or immune complexes consisting of CC an 88 kDa M. tuberculosis protein antigen or immune complexes consisting of CC an 88 kDa M. tuberculosis protein antigen complexed with an antibody CC detection of mycobacterial disease, particularly tuberculosis; in CC individuals at heightened risk of developing tuberculosis (TB). This CC individuals include human immunodeficiency virus (HIV)-infected subjects or other immunocompromised individuals. The method is a rapid and CC inexpensive screening procedure for detecting mycobacterial disease. CC or other immunocompromised individuals. The method is a rapid and CC inexpensive screening procedure for detecting mycobacterial disease. CC glycopeptide. The N-terminal amino acid sequence of CT27 CC glycopeptide. The N-terminal amino acid sequence of CT27 CC glycopeptide. The N-terminal applide is identified by fast atom CC sequence analysis of peptides generated by proteolysis of CC Mt 45 kDa/MPT 32 glycoprotein with chymotrypsin/trypsin. The Mt 45 kDa/MPT 32 early antigen is used in the serodiagnosis of tuberculosis.

                                                                                                                                                                                                                                                                                                                          AAB07398 standard; peptide; 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           identified in vivo, as compared to prior art in vitro screening methods, which require further examination to see if they maintain specificity in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This synthetic peptide is an example of a brain-homing peptide that was identified using a claimed method for obtaining molecules that home to a selected organ or tissue. This in vivo panning method typically involves administering a phage display library to a subject, and identifying expressed peptides which home to the desired organ or tissue, e.g. brain, kidney, anglogenic vascular tissue or timour tissue. The isolated peptides (see AAW13412-52, AAW11181-86) can be used to target e.g. drugs, toxins olabels to the selected organ/tissue (claimed) or to identify and/or isolate target molecules (claimed): The peptides can be directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Obtaining compound that homes to selected organ or tissue - by vivo panning method, specifically to identify brain, kidney, angiogenic vasculature or tumour tissue homing peptide(s)

                                                                                                                                                                                  or identifying the risk of a subject developing cancer (especially breast cancer), or monitoring the effect of therapy on a subject with cancer, comprising analysing a test sample using two-dimensional electrophoresis and detecting Breast Cancer-Associated Protein Isoforms (BPIs). The methods disclosed are used for the diagnosis and prognosis of breast cancer, for determining the severity of breast cancer, and for identifying a subject at risk of developing breast cancer, and monitoring the effect of therapy administered to a subject. Antibodies raised against the binding domain of a BPI, the binding domain of a BPI, a nucleic acid encoding a BPI, or a nucleic acid that inhibits the function of a BPI can be incorporated into a pharmaceutical
                                                                                                      composition for treating or preventing breast cancer. The methods use sensitive and specific biomarkers provide early diagnosis of breast cancer, and the compositions are more potent, specific, and has a more rapid effect with fewer side effects that other prior art methods. The present sequence is a tryptic digest peptide from a BPI of the

                                                                             07-OCT-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an enriched library fraction containing molecules that selectively home to a selected organ or tissue such as brain, kidney or tumour recovered by in vivo panning. The invention generally relates to the field of molecular medicine, drug delivery and to a method of invivo panning for identifying a molecule that homes to a specific organ. The molecules, e.g., peptides, peptidenmetics, proteins and fragments of proteins contained in an enriched library fraction may be administered to a subject as part of a pharmaceutical composition to rest disease or in diagnostic methods. The present sequence is a peptide from bacteriophage targetted to brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enriched library fraction comprising molecules recovered by in vivo panning that selectively home to a selected organ or tissue useful for treating disease or in diagnostic methods

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  screening, diagnosis or prognosis of Alzheimer's disease (AD) in a subject. The method comprises analysing a sample of brain tissue from a subject by 2D electrophoresis to generate a 2D array of 2C Alzheimer's disease-associated features (ADFs), whose relative abundance correlates with the presence, absence, stage or severity of 2D and comparing the abundance of each feature with the abundance of that chosen feature in brain tissue from persons free from AD. The 2C isoforms (ADPIs) detectable in brain tissue. The methods and 2C compositions of the invention are useful for the screening, diagnosis of AD in a subject, for determining the stage or severity of AD in a subject, for determining the stage or severity are in a subject, for identifying a subject at risk of developing AD, and for preventing AD, and for determining the stage or severity of treatment regime. An agent that modulates the activity of ADPI is cuseful in the manufacture of a medicament for the treatment or the prevention of AD in a subject. ABG67292-ABG68038 represent human ADPI ax

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the selected organ or tissue. The method comprises administering to the subject the library of diverse molecules, collecting a sample of the selected organ or tissue (e.g. brain or kidney), and recovering from the sample several molecules that home to the selected organ or tissue. The method is useful for identifying molecules, particularly useful for compression or descriptions. The identified molecule is useful for e.g. raising an compression of the selected organ. The identified molecule is useful for e.g. raising an compression of the selected organ. The identified molecule is useful for e.g. raising an compression of the selected organ. The identified molecule is useful for e.g. raising an compression of the selected organ. The identified molecule is useful for e.g. raising an compression of the presence of cancer that specific for a target molecule, targeting a desired moiety complex to the presence of cancer in a subject by linking an appropriate molecy to a tumour homing complex that specifically home to a selected organ and, therefore provides a significant advantage over previous methods, which require complex that specifically home to a selected organ and, therefore that a molecule identified using an in vitro screening method complex that specificity in the present brain homing peptides described in the present brain brain homing peptides described in th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in viro which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR72570 standard; Peptide; 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunosuppressive, nootropic, antiarteriosclerotic, antinicrobial, antiluleer, antiallergic and neuroprotective activities. The antagonists are useful in the treatment of an inflammatory disease or disorder, e.g. an autoimmune disease, diabetes, multiple sclerosis, rheumatoid arthritis, myasthenia gravis, systemic lupus erythematosis, chronic inflammation, atherosclerosis, inflammatory bowel disease, reactive arthritis, chronic infections, graft rejection, glngivitis, gastritis, ulcer, thrombosis, allergy and acute infections. AAH43896 to AAH43899 and AAB99542 to AAB99673 represent sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes anti-inflammatory peptides of heat shock protein hsp60, which are capable of acting as antagonists of hsp60 characterised by their ability to reduce or prevent the induction of a pro-inflammatory immune response of cells of the innate immune system by hsp60. The peptides have antiinflammatory, antidiabetic, antirheumatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-inflammatory peptides of hsp60, which are capable of acting as antagonists of hsp60, useful for treating an inflammatory disease or disorder, e.g. an autoimmune disease, diabetes, multiple sclerosis and

                                         AAW61058-60 represent partial amino lacid sequence of different immunoglobulin (Ig) molecules. The specification describes a non-naturally occurring IgG having an altered amino acid sequence compared to native IgG, which binds to FGRN with increased or decreased affinity. FCRn is a receptor found on the intestinal surface of the neonate and is responsible passage of maternal milk IgG from the intestinal lumen to the systemic circulation via the intestinal epithelial cells. FCRn is also used to prevent clearance of circulating IgG from the circulation. Altering the binding site on an IgG for FCRn allows greater or lower affinity for the FCRn receptor, which subsequently increases or decreases the half-life of circulating IgG, respectively. IgG's with an increased half-life can be used to treat immune conditions or diseases such as iddopathic thrombocytopaenic
                          dermatomyositis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from

                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY29345-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of inverdisease encoding the peptides are used for treatment of

                                                                                                                                                                                                                                                                                                                                                                                   Hepatotropic; antagonist; transforming growth factor betal; TGF-b1; competitive inhibition; collagen synthesis stimulation inhibitor; lextracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors. e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis.
                                                                                                                                                                                          (CIEN-)
                                                                                                                                                                                                                            24-NOV-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                  The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of

                                                                                                                                                                                                                           The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibitors of stimulation of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatotropic; antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; l extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors -

                                                                                                                                                                                                                                                                                                                        a function naturally performed by the corresponding yeast pheromone system protein; and (b) a second heterologous gene encoding a heterologous peptide, where the heterologous peptide modulates the interaction of the surrogate with the pheromone system in the yeast cell, and the modulation is a selectable or screenable event. The yeast cells are used in assaying a peptide for modulation of the activity of a non-yeast surrogate for a pheromone system protein and determining by detecting a change in the selectable or screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable or screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the pheromone is the selectable of screenable event whether the selectable is the selectable of screenable event whether the selectable is the selectable of screenable event whether the selectable is the selectable of screenable event whether the selectable is the selectable of screenable event whether the selectable is the selectable event whether the selectable is the selectable in the select
                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                    of the present invention.
                                                                                                                                                                                                                                                          pheromone signal pathway is activated or inhibited by the interaction the surrogate and the peptide. The present sequence represents an Ste2 agonist from the alpha-Mid-5 library which is from an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       in which the cell comprises: (a) a first heterologous gene encoding a heterologous surrogate of a yeast pheromone system protein, the surrogate being a kinase and performing in the pheromone system of the yeast cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant yeast cells - containing gene encoding system protein surrogate and gene encoding peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1998-446076/38.

The invention relates to Yeast cells engineered to express an exogenous protein capable of substituting for a yeast protein involved in the post-translational modification, transport, recognition or signal transduction of a yeast pheromone. The system can be used to identify drugs which inhibit or activate the ability of the surrogate to substitute for the cognate yeast pheromone system protein. Inhibitors of farnesyl transferase identified can be used for anticancer therapies.

                                                                                                       The present invention describes recombinant yeast cell mixtures (I). CC Each (I) has a heterologous G protein coupled receptor (GPCR) expressed cc in the cell membrane such that signal transduction (ST) activity via CFCR is modulated by interaction of extracellular region (ER) of GPCR with a heterologous polypeptide (P) which interacts with ER of receptor. CC Modulation of the ST activity by (P) provides a detectable signal. CC Also described is a recombinant yeast cell (II) that has a cell membrane cc which comprises a GPCR such that ST activity via GPCR is modulated by interaction of an ER of GPCR with an extracellular signal, and a (P) which is transported to a location allowing interaction with ER of GPCR. CC (I) is used for identifying a modulator of (P) expressed by the yeast cell which involves providing (I) which comprises heterologous GPCR and a heterologous test polypeptide, allowing the cells within the mixture to generate a detectable signal and then identifying the heterologous cest peptide as a modulator of the heterologous receptor protein cc expressed by the yeast cell. The yeast cells may be used to identify of the surrogate to substitute for the cognate yeast pheromone system contains. The yeast cell is also used to screen agonists and an analysists. The present sequence is used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                           The specification describes an assay for screening and identifying pharmaceutically effective compounds that specifically interact with and modulate the activity of a cellular receptor or ion channel. The assay uses a mixture of recombinant cells, each comprising a receptor protein whose signal transduction activity is modulated by an interaction with an extracellular signal, a recombinant gene encoding a potential receptor polypeptide, and a reporter gene construct. The assay is useful for rapid screening of large numbers of polypeptides to identify polypeptides antagonizing or agonizing receptor activity, and to identify drugs for modulating cellular activity. It is especially useful to identify ligands for orphan receptors, especially ligands for orphan cell surface receptors, which are useful in drug discovery. The present sequence represents an alpha-factor pheromone agonist, which was identified using the assay of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20-SEP-1994;

The method comprises rapidly screening large numbers of polypeptides in a yeast expression library to identify those polypeptides which induce or antagonise receptor bioactivity. The method is useful for screening and identifying pharmaceutically effective compounds that specifically interact with and modulate the activity of a cellular receptor or ion channel. The assay is particularly amenable for identifying surrogate ligands for orphan receptors. The present sequence represents a Ste2 agonist, identified from an alpha-Mid-5 library, using the method of the

  The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133
                                                                                                                                                                     Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatotropic; antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; lextracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    In vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                      The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases
                                                                                                                                                       The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphic nucleic acids encoding e.g. amylas oncogenes and histones, useful for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histope; kinase; colony stimulating fact complement related protein; cytochrome; kinesin; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local
                      The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins angiopoletin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, and Grave's disease), inflammation, cancer (e.g. cancers of the bladder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating fact; complement related protein; cytochrome; kinesin; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection; nervous system disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               QS
                                                                                        An antigenic conjugate, useful as a vaccine for AIDS, has the formula (SpNE)n (OMPC), where SPNE is a selected principal neutralisation epitope of HIV, which is one of 27 specified polypeptides (including the present sequence) or their fragments containing at least 5 amino acids and including the DRW or DKW region; OMPC is purified outer membrane proteosome of Neisseria (pref. N. meningitidis); and n is 1-200, indicating the number of SPNE moieties covalently linked to the OMPC. The conjugates may be substituted by anions, and conjugation may be via a bigeneric spacer. The SPNE polypeptides bind an HIV broadly neutralising monoclonal antibody (2F5 antibody) specific for the ectodomain of HIV gp41 transmembrane glycoprotein. They were originally identified in the screening of phage epitope libraries having the library used was library ALPHA described in AAR83295. The sequences of these polypeptides were deduced from their corresponding DNA

                                                                                                                                                                                             The present sequence is that of a D3 peptide derived from human CC inhibits endothelial cell proliferation and thus possesses canti-angiogenic activity. It is an example of D3 peptides of the CC invention (see AAY95405-26) that are analogues of certain sites in CC the HK domain 3, in this case amino acid residues Leu331-Tyr338, CC and in which native cysteine residues may be replaced by alanine CC and in which native cysteine residues may be replaced by alanine CC may also induce endothelial cell apoptosis. Compositions including CC the peptides are used in claimed methods for inhibiting angiogenesis, cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders contained the ICSO value for the present peptide was 42 uM for inhibition of the retina are treated. CC fibroblast growth factor-induced HUVEC cell proliferation.

Serious sees may be thwarted and economic losses avoided. The protein for monitering of disease states and to identify contaminated X in the sequence defines an undetermined amino acid residue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The polynucleotide sequences given in AAA26281 to AAA26336 encode the human secreted proteins given in AAA91346 to AAA91449. The human secreted proteins can have activities based on the tissues and cells they are expressed in Examples of the activities are: neuroprotective; nootropic; neuroleptic; antimanic; cerebroprotective; immunomodulatory; hardiconvilsant; cardiant; cytostatic; antiinflammatory; haemostatic; anticonvulsant; and vasotropic. The polynucleotides and proteins may be used to prevent, treat or ameliorate a medical condition, e.g. by protein or gene therapy. Conditions treatable by the proteins of the invention include neural, reproductive, or immune disorders, especially immunodeficiency, infection, lymphomas, demyelinating diseases, auto-immunities, cancer, general microbial infection, inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                aneurysms and haemorrhages. Specific examples include: Alzheimer's disease; Parkinson's; Huntington's; Tourette syndrome; multiple sclerosis; meningitis; ischaemia; prostate cancer; mania; dementia; obsessive compulsive disorder and viral prophylaxis. The polynucleotides and proteins can also be used in the detection of disorders associated with the function of the protein, for example, the detection of developmental disorders, sexually-linked disorders, or disorders of the cardiovascular system. They may also be used as food additives or preservatives. AAA2677 to AAA2680 and AAV91345 are sequences used in
